

Parasite Tendency Research Test

1. Place one inch of urine in the enclosed test tube.
2. Add 7 drops of Parasite Tendency Research Reagent.
3. Examine specimen for curdling or change to a white color.
4. If this change occurs, the test may be considered **positive** and diagnostic testing for presence of parasites is recommended.
5. Consider Healthy Habits products:
 - **Digestive Enzymes** = 2-4 capsules with meals for 30 days.
 - **Probiotic Super Strains** = 2 capsules daily for 30 days.
 - **Betaine Hydrochloride*** = 2-4 capsules before meals for 30 days.
 - **ParaTox** = 2 capsules 3x daily for 12 days, then 1 cap 3x daily for 30 days.
 - **Colon-Toddy or Triple Action Fiber** = as directed on label for 30 days.

It has been estimated that 50-70% of the population may test positive. Retest in 30 days after consuming above products.

Toxic Metal Tendency Test

1. Follow steps 1 and 2 above.
2. Look for specimen to turn purple in lower part of test tube.
3. If this change occurs, the test may be considered positive and diagnostic testing for presence of Heavy Metals is recommended.

* Betaine Hydrochloride is a Standard Process Laboratories product. It may be ordered from Biological Immunity Research Institute: 480-948-6766

How Does It Work?

We do not know, but the results are impressive.

Years ago, an aged Naturopathic Doctor walked into Dr. Martin's office and told him that he was impressed with Dr. Martin's dedication to natural wellness. Because of that, he was going to give Dr. Martin a secret formula that he had been using for years in his practice to detect the possible presence of parasites. It was a simple procedure of adding 7 drops of a reagent with a small amount of urine. The aged doctor wanted to be sure the formula would remain available to everyone.

Needless to say, Dr. Martin was skeptical, but accepted the gift. To test the accuracy of the reagent, whenever Dr. Martin found someone who tested positive with the Parasite Tendency Research Kit, he sent them to a diagnostic lab in Mesa, AZ which specialized in parasite diagnosis by stool analysis. This was back in the late 1970's to early 1980's.

Dr. Martin found that almost every person who tested positive with the Parasite Tendency Research Kit also tested positive for parasites at the lab. He continued to use the Parasite Tendency Research Kit with great success. He retired from active practice in 1994.

We found that whenever someone follows the detox protocol that allows them to eventually test negative with the Parasite Tendency Research Kit, symptoms that they have had for years suddenly disappear. They also say that they have more energy and feel better than they have for a long time.

Dr. Martin is retired from full-time practice now. During a move of his office and files, we came across this formula and have decided to once again make it available.

Please share your experiences with us. This is an on-going research project. The Parasite Tendency Research Kit is not to be used for diagnostic purposes. It is not a diagnostic test.

Contents: A proprietary blend of water, ferrous sulfate, ferric sulfate and aluminum sulfate.
